Supervisor - James Ohene-Djan

This week, the WebApp UI has been implemented and uploaded to a new project on Igor with basic functionality. The functionality that has been created is how the left hand navigation bar displays the last message of each different conversation and how each conversation that is clicked on displays the full conversation. To achieve this, the database schema has been redesigned and dummy data has been added to populate the database.

Research has also been conducted on creating a php based API which will enable the mobile applications to interact with the database on Igor. This will be one of the key focuses for next week. Other areas of focus will be to create a registration/login page for the WebApp and the ability to add Team members to each institutes application.

Once the API has been created and is hosted on Igor, edits will be made on Ionic Creator.]
